## Narrow Bandwidth Optical Parametric Amplifier

### FEATURES

- Built on well-known TOPAS-800 OPA basis
- Continuously tunable picosecond pulses in 320–5000 nm
- Near bandwidth limited output, <math><15\text{ cm}^{-1}</math> spectral width (typical)
- High stability is possible by seeding with femtosecond white-light continuum
- Repetition rate up to 100 kHz
- Computer-controlled

### APPLICATIONS

- Stimulated Raman Spectroscopy
- Surface sum-frequency spectroscopy

ORPHEUS-PS is a narrow bandwidth optical parametric amplifier of white-light continuum, designed for PHAROS / CARBIDE pump laser. This device is pumped by the picosecond pulses produced in SHBC-515 narrow bandwidth second harmonic generator and seeded by white-light continuum generated by femtosecond pulses. This enables very high pulse to pulse stability compared to other methods of generating tunable picosecond pulses. The white-light generation module is also integrated into the same housing as the amplification modules, enabling even better long term stability and ease of

use. The system features high conversion efficiency, bandwidth and diffraction-limited output, full computer control via USB port and LabVIEW drivers. A part of the PHAROS / CARBIDE laser radiation can be split to simultaneously pump a femtosecond OPA, providing broad bandwidth 630 nm – 16  $\mu\text{m}$  tunable pulses, giving access to the complete set of beams necessary for versatile spectroscopy applications, for example, narrowband Raman spectroscopy measurements, or surface sum-frequency spectroscopy.
